## We are all antimicrobial users.

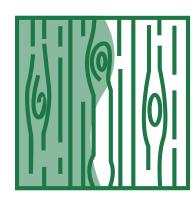

Every day, tiny superheroes known as antimicrobials are used to help kill or prevent the growth of bacteria, viruses and fungi. These good chemistries touch many aspects of our daily lives, often without us even realizing it.

You buy textiles and paint that are protected from breaking down

You have wood in your house that it is protected from decay caused by mold and mildew

By extending the life of products you use every day, antimicrobials help us preserve our precious resources.
