ANTIMICROBIALS HELP PROTECT THE WORLD.

Clothing

You can't see them — you may not even be aware they're there — but the world would look very different without antimicrobials preserving and protecting materials.

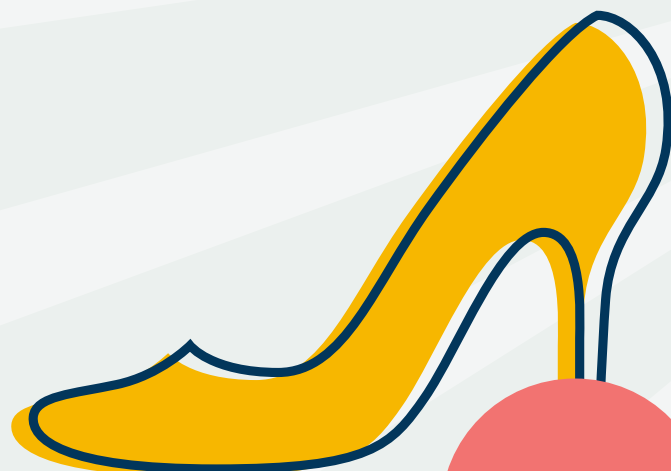

Regulated by the government and often effective even in trace amounts, antimicrobials prevent harmful microbes from contaminating, ruining and spoiling many of the products, building materials, and manufacturing processes we depend on every day. They help make products and materials stronger, more durable, and longer-lasting — saving you money, helping with environmental sustainability, and making life a little better all around.
