

DISINFECTANTS

In Public Places/Spaces – Offices

Antimicrobial products, such as disinfectants, are critical to reducing the transmission of disease-causing pathogens, particularly in public places where a wide variety of people traverse or congregate.

Disinfectants are used to help deactivate and destroy germs in workplaces. No matter the industry, a healthy workplace environment is key for employees' productivity, performance, and well-being. Harmful pathogens, like bacteria and viruses, can live on surfaces in the office for long periods of time. Without regular disinfection and sanitization, these germs can infect people, making them sick. The most important areas to regularly disinfect and sanitize in offices include reception areas, break rooms, lounges, kitchens, restrooms, and elevators. High-touch or shared objects include countertops, doors, handles, light switches, desks, phones, workspaces, printers, copiers, and chairs.
